Sales of JUUL e-cigarettes skyrocket, posing danger to youth

Product dominated the U.S. e-cigarette market by end of 2017

Sales of JUUL, an e-cigarette shaped like a USB flash drive, grew more than seven-fold from 2016 to 2017, and held the greatest share of the U.S. e-cigarette market by December 2017. The findings, from an analysis of retail sales data from 2013-2017, were released today by the Centers for Disease Control and Prevention (CDC) in [JAMA](#).

Use of JUUL by youth in schools, including in classrooms and bathrooms, has been widely reported. Most e-cigarettes contain nicotine, and JUUL contains among the highest nicotine content of any e-cigarette on the U.S. market. Nicotine is highly addictive and can harm a child's brain development, which continues into the mid-20s.

“The popularity of JUUL among kids threatens our progress in reducing youth e-cigarette use,” said Robert Redfield, M.D., director of CDC. “We are alarmed that these new high nicotine content e-cigarettes, marketed and sold in kid-friendly flavors, are so appealing to our nation's young people.”

Rapid evolution of e-cigarette market

No single e-cigarette manufacturer dominated the US market through 2013. However, sales of British American Tobacco e-cigarette devices surged 146% during 2014 and led the market well into 2017. During 2016-2017, JUUL Labs' sales increased 641 percent — from 2.2 million devices sold in 2016 to 16.2 million devices sold in 2017. By December of 2017, JUUL Labs' sales comprised nearly 1 in 3 e-cigarette sales nationally, giving it the largest market share in the United States.

Like other e-cigarettes, JUUL is a battery-powered device that heats a nicotine-containing liquid to produce an aerosol that is inhaled. JUUL comes in a variety of flavors, including mango and creme, and also uses nicotine salts, which can allow high levels of nicotine to be inhaled more easily and with less irritation. Other manufacturers have recently started making look-alike e-cigarette products.

The CDC study included purchases from most US retail stores. It did not include sales through the Internet or through “vape shops,” so sales may be underestimated. Many of the sales likely reflect products obtained directly or indirectly by youth. A recent [analysis](#) found that 74 percent

of youth who used JUUL reported obtaining the device from a physical retail store, and about half reported obtaining the device from a social source such as a friend or family member.

The use of e-cigarettes is unsafe for children, teens, and young adults

The U.S. Surgeon General has concluded that e-cigarette use among youth and young adults is a public health concern, and that e-cigarette aerosol is not harmless. Over the past several months, the U.S. Food and Drug Administration has taken a series of actions as part of its [Youth Tobacco Prevention Plan](#) to more immediately target the illegal sales of e-cigarettes to youth, as well as youth-oriented marketing and appeal of these products.

In September 2018, FDA announced the issuance of more than 1,300 warning letters and civil money penalty complaints to retailers who illegally sold JUUL and other e-cigarette products to minors. The FDA has also requested information from JUUL, and several other manufacturers, related to marketing, youth appeal and product design, including details on the companies' plans to address the problem of youth use of their products.

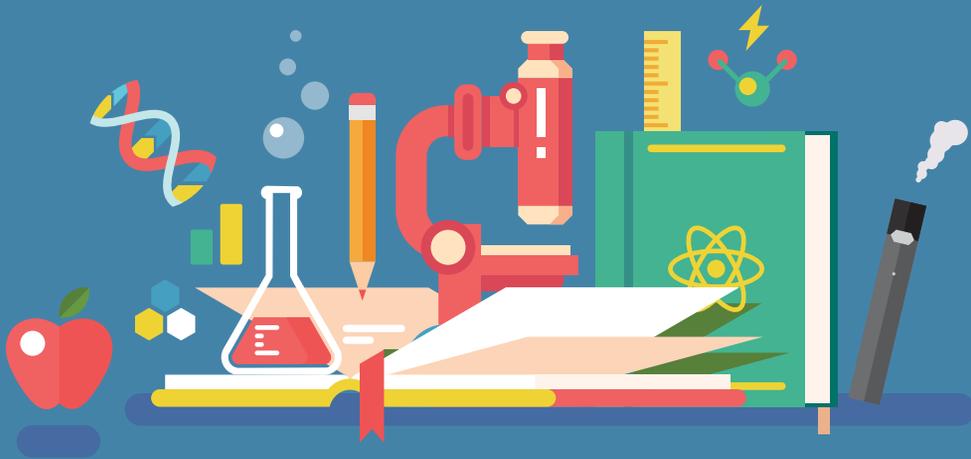

“There are no redeeming benefits of e-cigarettes for young people,” said Corinne Graffunder, DrPH, director of CDC’s Office on Smoking and Health. “The use of certain USB-shaped e-cigarettes is especially dangerous among youth because these products contain extremely high levels of nicotine, which can harm the developing adolescent brain.”

[U.S. Department of Health and Human Services](#)

[CDC works 24/7](#) protecting America’s health, safety, and security. Whether diseases start at home or abroad, are curable or preventable, chronic or acute, or from human activity or deliberate attack, CDC responds to America’s most pressing health threats. CDC is headquartered in Atlanta and has experts located throughout the United States and the world.

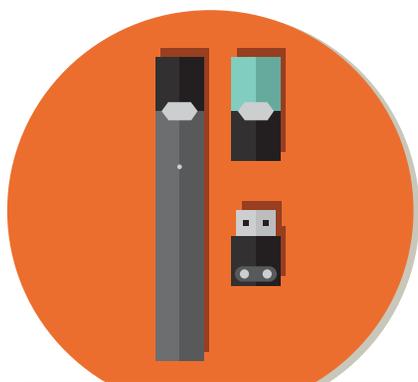

TEACHERS AND PARENTS: That USB Stick Might Be an *E-cigarette*

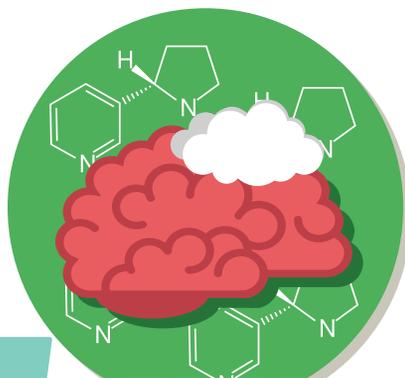

E-cigarettes are the most commonly used tobacco product among U.S. middle and high school students.

Some e-cigarettes don't look like tobacco products, so some kids use them unnoticed in schools, including in classrooms and bathrooms.

An increasingly popular e-cigarette, called JUUL, is shaped like a USB flash drive.

JUUL delivers a high dose of nicotine. Nicotine is highly addictive and can harm adolescent brain development.

TOBACCO PRODUCT USE IN ANY FORM, INCLUDING E-CIGARETTES, IS UNSAFE FOR YOUTH.
